

Advanced Search Technology (A.S.T)

This documentation describes advanced search technology designed for INT48pro labcad developed by its author, Jeremy E. Laughery.

AST allows the search of INT48pro's tables at a faster pace. The need for such process exists due to the fact that I will implement about 750 to 1000 integration forms when finished. Implementation consists of a 3-dimensional mapping of a 2-dimensional table. As this will be very time consuming, it will be a vital part of INT48pro's growth in the future.

As an example of the power of AST, INT48pro will search its database at high speeds or not even elect to search it at all! This is an example of the high speed and high power you will see in the very near future development of INT48pro labcad.
