

Agenda v6.0

N. Rivero

September 3rd, 2003

1 Overview

- Agenda, Phonebook, Lists and Records.
- Friendly and complete interface (copy, cut, paste and other commands to simplify data entry and edition).
- Export data to html format.

2 Requirements

2.1 Hardware requirements

This program is written for the HP49G. It has been tested with ROM 1.19 beta 5 and it should work with newer ROM versions.

2.2 Software requirements

Requires Menú Fácil v5.0 or above and VPG v1.3 or above. This two programs are currently only available in Spanish, but there is no language component inside the programs. I may translate the documentation in the future if I receive enough requests.

2.2.1 Upgrade note

Important: If you are replacing version 5.x with 6.x run IniA after install.

3 Integrity

3.1 Installation packages

File: agenda.install.49code (ESP)

Checksum: # 11548d

Bytes: 12539

File: agenda.install.49code (ENG)

Checksum: # 27212d

Bytes: 12552.5

3.2 Library

Number: 1504

Checksum: # 65047d (ESP)

Bytes: 27182.5

Checksum: # 35792d (ENG)

Bytes: 27189.5

3.3 Sources

File: source.49dir

Checksum: # 22373d

Bytes: 101409.5

4 Installation

4.1 Installation

1. Send `agenda.install.49code` to the calculator.
2. Run the program and choose a port to install the library (sorry the installer is in Spanish, it says *puerto* instead of *port* but you'll figure out what to do anyway).

4.2 Uninstall

1. Open the file explorer (press the *FILES* key or type *FILER* and press ENTER).
2. Go to the port where the agenda is installed and erase it.

5 Description

5.1 Initialization

To use the agenda you have to initialize it first. In order to do so create a directory (which will contain your data), enter it, and from there run `IniA`. This will create the necessary files in this directory, as well as the file `agenda.ini` in `HOME`. In case you need to reinitialize, delete `agenda.ini` and repeat the process¹. In this way you can move the data directory, rename it, or even have more than one set of data separately.

The operation of the program is intuitive and not worth to be described.

Note: To access the inactive entries in the phonebook use the `T00L` key on the corresponding letter.

5.2 Available commands

- `AgeA` Runs the agenda.
- `TelsA` Runs the phonebook.
- `LisA` Runs the lists.
- `OpcA` Runs the options menu.
- `IniA` Initialization.
- `BF->$` Extra command. Takes a base date² in level 2 and a final date³ in level 1 and returns a string like `Year X, day Y`.
- `Age->html` Export agenda data⁴.
- `Tels->html` Export phonebook data⁵.
- `Lis->html` Export lists data⁶.
- `BitA->html` Export records data⁷.

6 Changes

6.1 Version 6.0

- Text editing is done now using small font, no matter the state of flag `-73`.

¹If you have data in the data directory you won't lose it.

²In `dd.mmaaaa` format.

³Also in `dd.mmaaaa` format.

⁴Requires initialized agenda. This command is not completely language independent.

⁵Requires initialized agenda. This command is not completely language independent.

⁶Requires initialized agenda. This command is not completely language independent.

⁷Requires initialized agenda. This command is not completely language independent.

- Library distributed unprecompressed.
- Added command to export records data to html.
- Commands to export to html (hypertools' commands) are now improved and included in the agenda.
- Agenda user interface improved.
- Added records, accesible through the agenda ui and maintained via the options menu (**OpcA**).
- **ContToolF** used by phonebook substituted by **ContKeyF** (Menú Fácil 5.0).
- Changed todo lists name to only lists.
- Bugfix in listas copy command.

6.2 Version 5.31

- Added no time option for appointments.

6.3 Version 5.3

- Added *inactive zone* to the phonebook to store unused phones.
- Better organization of week view.
- Added command *Extract all*.
- Added *Fortnightly* type.
- Fixed bug when pasting working days appointment on week ends (it is converted to normal).

6.4 Version 5.21

- Day numbers are correct when choosing *View week*.

6.5 Version 5.2

- Last changes are shown correctly next to the corresponding day in month view.
- Added *Monthly* type (shown as 18., if there is also a holiday in the same day it is shown as 18!).
- Added *Daily* type.
- Added *Working days* type.
- Added type marks next to the time of each message.
- Added *View week* and *Fast calendar*.

6.6 Version 5.1

- Added *Holiday* appointment type. It's the same as yearly, except that it is shown as | next to the corresponding day.
- Spanish and English versions are now distributed together in the same archive.
- Month display reorganized.
- Added command BF->\$.

6.7 Version 5.0e

- Translation to English of version 5.0 (first English version of this program).

6.8 Version 5.0

- Adapted for the HP49G. No longer runs on the HP48 (use version 4.01).
- Uses advantages of Menú Fácil v4.2 (T00L key for extra commands, etc.).
- Several modifications to the organization of the interface.
- Added *other data* field to the phonebook.
- Bug fix (trying to erase old data when there's no data could nuke the calc).

6.9 Version 4.01

- Bug fix (initial order of appointments in the agenda was not correct if all are weekly).

6.10 Version 4.0

- Uses advantages of Menú Fácil 4.1.
- Multiple todo lists.
- Data compression on exit removed (to compress you have to go to the configuration menu).
- VPG is required now (used for viewing data).
- Added *e-mail* and *URL* fields to the phonebook.
- Added *notes* and *date of last modification* for each task of the todo list.
- Faster and less memory consuming.
- Reduction of library size.

6.11 Version 3.1

- Some minor fixes.
- Added support for ED/TED as editor.
- Can now quit pressing **ON** from any screen without losing last changes.
- Added *Exit and compress* to the *Exit* menu when BZ is active.
- Month generation a bit faster (still slow though).

6.12 Version 3.0

- Rewritten interface, based now on Menú Fácil.
- Possibility of edition and compression via external programs (BZ and String Writer).
- New commands: move, duplicate, copy, etc.
- User can now choose the data directory.
- Resources information.

6.13 Version 2.0

- Added todo list.
- Cache for current month graphic.
- First library version.
- No longer runs on S/SX.

6.14 Version 1.0

- First version.
- Compatible with S/SX (it was written in an SX).

7 About

7.1 Usage conditions

- I *offer no guarantee of any kind* for any damage this program may produce, so if you are doubtful backup your memory or don't try it.
- This program is freeware and it cannot be sold.
- You may modify it for your personal use. To distribute a modified version (a better one, of course) you have to notify me first.
- This documentation should always be included in the package.

7.2 Where to find me

If you like this program send me your comments. Suggestions and bug reports are also welcome. My page is at:

<http://iie.fing.edu.uy/~nicolas/>.

If you have a question and you speak Spanish try the f.a.q. in my page first:

<http://iie.fing.edu.uy/~nicolas/hp4x-faq.html>.
